- Conclusions

Definitions

- Banks' distress
- Credit risk management
- Basel Committee on Banking Supervision (1974):
 - Basel I (1988) - minimum capital requirements;
 - Basel II (1997) - quantitative models,
 - Basel III (2013) - strengthen the global capital standard.
- Credit risk modelling according to the Basel accord;
- CAMELS Ratings (1-Outperforming, ... , 5-Failure).

- Financial crisis-led bank failures.
- Use of predictive analytics in internal risk modelling,
- Creation of early warning systems to curb bank failure.

The aim of this study was to:

Investigate financial risk inherent within Zimbabwean banks and model the economic capital as an optimal hedge against bank distress.

Methods - Bayesian Networks

1 Qualitative component

Figure: A representative Bayesian Network: Source- Varuttamaseni (2011)

2 Quantitative component

$$p(X_1, \dots, X_n) = \prod_{i=1}^n p(X_i | pa(X_i)).$$

Methods - Estimating Economic Capital using VaR

- Value at risk (*VaR*)

Figure: Profit and Loss distribution: Source – Yamai and Yoshiba (2002a)

Methods - Estimating Economic Capital using VaR

Cont'd.

- Conditional Value at Risk (*VAR*)

$$CVaR_p(p) = \frac{\int_{-F^{-1}(1-p)}^{\infty} l \cdot f(l) dl}{p}.$$

- Economic Capital (*EC*) as $EC = UL - EL$,
where

$$UL = q_{\alpha}^N \cdot \sigma, \tag{1}$$

q_{α}^N = quantile of $N(0, 1)$ distribution and $EL = CVaR$.

- Returns on Risk Adjusted Capital(RAROC)

$$RORAC = \frac{\text{Net Income}}{\text{Economic Capital}}$$

- Financial ratios (Moyo et al., 2019)
 - Performance: ROA, ROE, NIM
 - Capital: MS, Conc, SR, BO
 - Growth: CS, Tax, Reserve, RBS, Crisis
 - Credit risk: CR1, CR2
 - Cost Management Efficiency: CE1, CE2, Efficiency, IMI
 - Business mix: Divers, BM1, BM2
 - Liquidity: Liq1, Liq2, LAR
 - Loan funding structure
 - Foreign exchange risk management efficiency
 - Ownership: Government vs Private

Results - Descriptive Statistics

| Microeconomic factor | Min | Max | Mean | Std Dev |

Table: Liquidity Position of Banks 2018: Source – Author

Conclusions

- RORAC measures inconsistent with Z-scores for some banks - same risk level (EC) used for all banks.
- The same capital requirements (regulatory or economic) cannot be imposed to all banks.
- If EC is controlled then probability of default can also be controlled and hence the rating of a bank.
- Future work should aim at unifying methodological tools from diverse disciplines to develop models that optimally allocate the EC and automated financial systems using these models to ease the computation of EC for end users.

"The future of banking is not just about technology, it's about combining it with human intelligence and expertise to offer clients a better experience" - Brian Moynihan, CEO of Bank of America"
