**Problem Sheet 7, June 18, 2013**

1. (a) Let  $M$  be the midpoint of the side  $AB$  in the triangle  $ABC$ . If  $CM$  has length  $h$ , prove that

$$2(a^2 + b^2) = c^2 + 4h^2.$$

This is known as *Apollonius' theorem*.

- (b) Show how to draw a triangle knowing only the lengths of the three medians  $h, k$  and  $\ell$ . (You can either use (i), or find a better way.)
2. Two circles  $C_1, C_2$  with centres  $O_1, O_2$  are externally tangent at the point  $P$ . A straight line through  $P$  meets  $C_1, C_2$  respectively at  $A$  and  $B$ . Show that the tangents to the circles at  $A$  and  $B$  are parallel.
3. Find the last two digits (and then the last three digits) of  $1! + 2! + 3! + \dots + 99!$ .
4. Denote the top of a cube by  $ABCD$  and the bottom by  $A_1, B_1, C_1, D_1$ , so that  $A$  is directly above  $A_1$  and so on. Take midpoints of the six edges  $AB, BB_1, B_1C_1, C_1D_1, D_1D$  and  $DA$ . show that a plane containing any three of these points contains them all and deduce that these points form the vertices of a regular hexagon.
5. A quadrilateral in which a circle can be drawn which touches each of the four faces is called a *circumscribable quadrilateral*. If  $r$  is the radius of the circle and  $s$  is half the perimeter of the quadrilateral, prove that the area of the quadrilateral is  $rs$ .
6. What is the smaller angle between the hands of the clock at 12:25pm?

**Senior Questions**

1. Solve the equation  $\cot^{-1} x - \cot^{-1}(x + 2) = \frac{\pi}{12}$ .
2. If  $x$  is a number between 4 and 8 and  $y$  is a number between 20 and 40, what are the smallest and largest possible values of  $\frac{y}{x}$ ?

---
