Solution Sheet 8, June 20, 2012

## Answers

1. Use the fact that $1997^{4}$ ends in a one. Answer is 7
2. 500
3. Pythagoras' Theorem.
4. Assume $x \leq y$, then $(7,42),(8,24),(9,18),(10,15),(12,12)$. Repeat for $x$ and $y$ swapped.
5. (a) 1
(b) The sum of the geometric series $S=1-2+4-8+\ldots+(-2)^{n-1}=\frac{1-(-2)^{n}}{1-(-2)}=\frac{1+2^{n}}{3}$ since $n$ is odd. Then $3 S=1+2^{n}$, so $1+2^{n}$ is divisible by 3 . Similarly $1+2^{m}$ is divisible by 3 . Hence the gcd is at least 3 .
6. ... its a rectangle.
