Course Staff

Course Convener and Lecturer in charge Dr. Elias Aboutanios MSEB718 elias@unsw.edu.au
Tutor: TBA
Laboratory Contact: TBA

Consultations: You are encouraged to ask questions on the course material, after the lecture class times in the first instance, rather than via email. When emailing the lecturer, ALL email enquiries should be made from your student email address with ELEC4621 in the subject line, otherwise they will not be answered. Lecturer consultation times will be advised during lectures.

For your benefit, the following two things will be provided:

- A one hour class per week will be set up, where a tutor will be available to answer your questions and help you. If needed and whenever possible, I may be available too. In case that you do not receive a satisfactory answer, you may contact me to discuss your question.

- A discussion forum will also be set up on Moodle. You are strongly encouraged to take full advantage of that medium to pose any queries or technical questions. This will be open for you to have discussions among yourselves. I will also be involved in those discussions to answer questions when needed. There are some mechanisms that I am going to institute this semester to address any large scale weaknesses. This forum and the suggestion box will be part of them. If I see something that needs to be addressed in class then I will do so.

- For everyone’s benefit, I will do my best to answer questions and provide additional explanations through short videos. This will be prepared and posted whenever possible and as needed.

Keeping Informed: Announcements may be made during classes, via email (to your student email address) and/or via online learning and teaching platforms – in this course, we will use Moodle https://moodle.telt.unsw.edu.au/login/index.php. Please note that you will be deemed to have received this information, so you should take careful note of all announcements.

Course Summary

Contact Hours

The course consists of 3 hours of lectures each week.

Context and Aims

This subject builds upon the material introduced in Elec3104, focusing exclusively on digital signal processing techniques. Most signals exist in the real world in analog form. However, the large proportion signal processing is nowadays done on digital processors (including your smartphone). This naturally requires a conversion of the real-world signals to digital form and then conversion back to the analog form following the processing. In this subject, we aim to give you a good grasp of important concepts that allow this process to take place. These include the conversion from analog to digital and vice versa, digital filtering, transforms, noise and its implications, estimation and prediction.

Below is an indicative topics list:

- Sampling, aliasing and the relationship between discrete and continuous signals
- Review of Fourier transforms, the Z-transform, FIR and IIR filters, and oscillators
- Filter implementation techniques, structures and numerical round-off effects
- Filter design techniques
- Auto-correlation, cross-correlation, and power spectrum estimation techniques
- Linear prediction
- Wiener filters, LMS adaptive filters, and applications.
- Multi-rate signal processing and subband transforms.
- Time-frequency analysis, the short time Fourier transform, and wavelet transforms (time permitting)

Course Details

Credits

This is a 6 UoC course and the expected workload is 10–12 hours per week throughout the 13 week semester. The University defines a UoC as requiring 25 hours of total learning effort per semester (spread over lectures, tutorials, labs, and the student's own study time.) Therefore, it is expected that 150 hours will be allocated to this course.
Relationship to Other Courses

This is a 4th year professional elective course in the School of Electrical Engineering and Telecommunications.

Pre-requisites and Assumed Knowledge

The pre-requisite for this course is ELEC3104, Digital Signal Processing. It is also essential that you are familiar with elementary signal processing concepts and linear algebra before this course is attempted. It is further assumed that students have a working knowledge of Matlab, which is used in the laboratory projects.

Following Courses

The course is not a pre-requisite for any other courses offered by the School of EE&T. However, students undertaking postgraduate studies involving signal processing should find that this course provides an excellent preparation for such further study. As an undergraduate professional elective, this course provides a solid foundation for a surprisingly wide range of professional engineering design and development activities.

Learning outcomes

After successful completion of this course, you should be able to:

1. Have a more thorough understanding of the relationship between time and frequency domain interpretations and implementations of signal processing algorithms;
2. Understand and be able to implement adaptive signal processing algorithms based on second order statistics; and
3. Be familiar with some of the most important advanced signal processing techniques, including multi-rate processing and time-frequency analysis techniques.

This course is designed to provide the above learning outcomes which arise from targeted graduate capabilities listed in Appendix A. The targeted graduate capabilities broadly support the UNSW and Faculty of Engineering graduate capabilities (listed in Appendix B). This course also addresses the Engineers Australia (National Accreditation Body) Stage I competency standard as outlined in Appendix C.

Syllabus

The syllabus comprises:

1. FIR filters; all-pole IIR lattice filters and their implementation.
2. Fixed-point or finite word length implementations and effects.
3. Random processes; auto-correlation; cross-correlation; and power spectrum estimation.
4. Estimation and detection.
5. Adaptive filters; wiener filters; adaptive noise cancellation.
6. Linear prediction and applications of linear prediction.
7. Multi-rate signal processing systems; quadrature mirror filter banks; multilevel filter banks.
8. Time frequency analysis; short-time Fourier transform; and wavelet transform.
Teaching Strategies

Delivery Mode

The teaching in this course aims at establishing a good fundamental understanding of the areas covered using:

- Formal face-to-face lectures, which provide you with a focus on the core analytical material in the course, together with qualitative, alternative explanations to aid your understanding;
- Tutorials, which allow for exercises in problem solving and allow time for you to resolve problems in understanding of lecture material, while also providing opportunities for you to stretch your understanding to a variety of application domains;
- Laboratory sessions, which support the formal lecture material and allow you to develop confidence in your ability to convert the formal material into solutions to important practical problems.

This semester I am introducing some innovations into the course delivery. While the Monday lecture will be according to the standard format, the Thursday will have a free format to allow me the flexibility to tailor the delivery to your learning and better cater for your needs. Therefore, the Thurs. lecture might include some formal delivery (if required), but may also include some demos, Matlab exercises, etc... Additionally, I will be using a surface pro to annotate some material and if suitable to post it on Moodle for your benefit.

Learning in this Course

You are expected to attend all lectures, and attempt the assignment and seminar in order to maximise learning. Prior to each lecture you should prepare the recommended reading if given. In addition to the lecture notes/video, you should read relevant sections of the recommended text. Reading additional texts will further enhance your learning experience. Group learning is also encouraged. UNSW assumes that self-directed study of this kind is undertaken in addition to attending face-to-face classes throughout the course.

Tutorial Classes

You should attempt all of your problem sheet questions in advance of attending the tutorial classes. The importance of adequate preparation prior to each tutorial cannot be overemphasized, as the effectiveness and usefulness of the tutorial depends to a large extent on this preparation. Group learning is encouraged. Answers for these questions will be discussed during the tutorial class and the tutor will cover the more complex questions in the tutorial class.

Note: while official solutions to problem sets may be made available, reading solutions without first devoting substantial thought to the problems (including revision of lecture notes) is entirely counter-productive and can deprive you of the opportunity to truly come to grips with weaknesses in your understanding. A superior method of study is to discuss challenging questions with your peers, rather than reading solutions.

Laboratory Program

You will find that the assessed laboratories require careful preparation, which is best done by reviewing lecture materials to the point where you understand them thoroughly. You will find that the work put into laboratories more than pays for itself, because preparing for the laboratories is one of the most effective study techniques for the course as a whole.
Laboratory Exemption

There is no laboratory exemption for this course. Regardless of whether equivalent labs have been completed in previous courses, all students enrolled in this course must take the labs. If, for medical reasons, (note that a valid medical certificate must be provided) you are unable to attend a lab, you will need to apply for a catch-up lab during another lab time, as agreed by the laboratory coordinator.

Assessment

The assessment scheme in this course reflects the learning objectives. Assessment in laboratories is intended to encourage you to get the most from these learning experiences. Mid-session tests encourage you to keep on top of the material and to allow both you and your lecturer to discover weaknesses in understanding early. Assessment in the final exam is very important to overall learning in the course; preparation for the final exam provides the best opportunity to appreciate the course as a whole and cement your understanding of its heavily interlinked concepts.

Laboratory Assessment

Laboratories are entirely about learning and understanding what you have learned. The laboratory assessment is designed to check your knowledge and understanding as you progress through the course.

All laboratories in the course are assessed within the lab itself. Each assessed lab contributes 5% to your overall mark. The best 5 out of six lab marks are counted towards your final assessment. It important, however, to see that the labs are worth much more than the marks as they permit you to apply your knowledge in the confidence that it can build and the understanding it can impart.

The lab session is effectively for allocated for the assessment and so a only a few minutes of assessment time are reserved for each of you. It is essential that you complete (or at least fully attempt) the exercise before coming to the lab. The laboratories in this course are not “demonstrations.” Instead they are design exercises, where you design a solution to a problem, implement it and explore the behaviour of your solution. This means that you need to create and test most, if not all of your solution before coming to the laboratory. In doing this, you will typically find the need to revise your lecture notes to deepen your understanding of the topic that is covered by the laboratory. This is intended and it is expected that you can demonstrate familiarity with all the relevant lecture material while being assessed.

It is, nonetheless, noted that you may have gaps in your knowledge and therefore need help. In this respect, the laboratory demonstrators are highly knowledgeable and helpful. They can assist you to resolve weaknesses in your understanding, but you must raise any concerns that need their assistance near to the beginning of the scheduled laboratory period. Most of their time in the last two hours of the laboratory will be spent assessing your work. You can get all of your work assessed at once, or you can ask the laboratory demonstrators to assess your work in stages. If they discover problems with one part of your solution, they will generally let you know what the problem is and give you an opportunity to correct the errors and be reassessed, but this might only be possible if you show them your work near to the beginning of the laboratory session.

You should follow all instructions given by the laboratory demonstrators to facilitate efficient assessment of your work. Where analytical work is involved, you should have that work available for the laboratory demonstrators to inspect, in a separate neatly presented laboratory book.
Note also that the labs are meant to stimulate discussions. As you attempt the exercises prior to the lab in your own time, you will have the opportunity to discuss the labs in the forums that are provided on Moodle. The questions you ask can be answered by your peers, or by the course teaching staff.

**Quizzes**

The two mid-session tests will be conducted, in weeks 7 and 11, to probe your general understanding of the course material and provide you with feedback on your progress through the analytical components of the course. Questions may be drawn from any course material up to the end of the week preceding the relevant mid-session test. Marks will be assigned according to the correctness of the responses. Mid-semester tests are closed book assessments. You will not be permitted to refer to your lecture notes or any other written materials during the test. Moreover, it is a serious offence to copy or use answers obtained from any of your classmates during these tests.

**Final Exam**

The exam in this course is a standard closed-book 2 hour written examination. Only University approved calculators are allowed. The examination tests critical thinking and general understanding of the course material in a controlled fashion. Questions may be drawn from any any material delivered during the course, unless specifically indicated otherwise by the lecturer. Marks will be assigned according to the correctness of the responses.

You will be permitted to bring one A4 sheet of paper, containing your own handwritten notes, on both sides of the sheet if required.

**Course Resources**

**Textbooks**

- **Prescribed textbook**
  - A complete set of typeset lecture notes for the course are available via the course web-site. These were originally written by Prof. David Taubman and are being updated by me. They should be treated like a textbook and read carefully as essential prescribed material for the course. These notes will be

- **Reference books**
  - Simon Haykin, Modern Filters, Macmillan Publishing Company.

**On-line resources**

**Moodle**

As a part of the teaching component, Moodle will be used to disseminate teaching materials, host forums and occasionally quizzes. Assessment marks will also be made available via Moodle: [https://moodle.telt.unsw.edu.au/login/index.php](https://moodle.telt.unsw.edu.au/login/index.php).

**Announcements and Mailing list**

Announcements concerning course information will be given in the lectures and/or on Moodle and/or via email (which will be sent to your student email address).
Other Matters

Academic Honesty and Plagiarism

Plagiarism is the unacknowledged use of other people’s work, including the copying of assignment works and laboratory results from other students. Plagiarism is considered a form of academic misconduct, and the University has very strict rules that include some severe penalties. For UNSW policies, penalties and information to help you avoid plagiarism, see: https://student.unsw.edu.au/plagiarism. To find out if you understand plagiarism correctly, try this short quiz: https://student.unsw.edu.au/plagiarism-quiz.

Student Responsibilities and Conduct

Students are expected to be familiar with and adhere to all UNSW policies (see https://my.unsw.edu.au/student/atoz/ABC.html), and particular attention is drawn to the following:

Workload

It is expected that you will spend at least ten to twelve hours per week studying a 6 UoC course, from Week 1 until the final assessment, including both face-to-face classes and independent, self-directed study. In periods where you need to complete assignments or prepare for examinations, the workload may be greater. Over-commitment has been a common source of failure for many students. You should take the required workload into account when planning how to balance study with employment and other activities.

Attendance

Regular and punctual attendance at all classes is expected. UNSW regulations state that if students attend less than 80% of scheduled classes they may be refused final assessment.

General Conduct and Behaviour

Consideration and respect for the needs of your fellow students and teaching staff is an expectation. Conduct which unduly disrupts or interferes with a class is not acceptable and students may be asked to leave the class.

Work Health and Safety

UNSW policy requires each person to work safely and responsibly, in order to avoid personal injury and to protect the safety of others.

Special Consideration and Supplementary Examinations

You must submit all assignments and attend all examinations scheduled for your course. You should seek assistance early if you suffer illness or misadventure which affects your course progress. All applications for special consideration must be lodged online through myUNSW within 3 working days of the assessment, not to course or school staff. For more detail, consult: https://student.unsw.edu.au/special-consideration.

Continual Course Improvement

This course is under constant revision in order to improve the learning outcomes for all students. Please forward any feedback (positive or negative) on the course to the course convener or via the Course and Teaching Evaluation and Improvement Process. You can also provide feedback to ELSOC who will raise your concerns at student focus group meetings. As a result of previous
feedback obtained for this course and in our efforts to provide a rich and meaningful learning experience, we have continued to evaluate and modify our delivery and assessment methods.

**Administrative Matters**

On issues and procedures regarding such matters as special needs, equity and diversity, occupational health and safety, enrolment, rights, and general expectations of students, please refer to the School and UNSW policies:

http://www.engineering.unsw.edu.au/electrical-engineering/policies-and-procedures

https://my.unsw.edu.au/student/atoz/ABC.html
Appendices

Appendix A: Targeted Graduate Capabilities

Electrical Engineering and Telecommunications programs are designed to address the following targeted capabilities which were developed by the school in conjunction with the requirements of professional and industry bodies:

- The ability to apply knowledge of basic science and fundamental technologies;
- The skills to communicate effectively, not only with engineers but also with the wider community;
- The capability to undertake challenging analysis and design problems and find optimal solutions;
- Expertise in decomposing a problem into its constituent parts, and in defining the scope of each part;
- A working knowledge of how to locate required information and use information resources to their maximum advantage;
- Proficiency in developing and implementing project plans, investigating alternative solutions, and critically evaluating differing strategies;
- An understanding of the social, cultural and global responsibilities of the professional engineer;
- The ability to work effectively as an individual or in a team;
- An understanding of professional and ethical responsibilities;
- The ability to engage in lifelong independent and reflective learning.

Appendix B: UNSW Graduate Capabilities

The course delivery methods and course content directly or indirectly addresses a number of core UNSW graduate capabilities, as follows: <select those which apply (maybe 3-5) and adapt to suit course>

- Developing scholars who have a deep understanding of their discipline, through lectures and solution of analytical problems in tutorials and assessed by assignments and written examinations.
- Developing rigorous analysis, critique, and reflection, and ability to apply knowledge and skills to solving problems. These will be achieved by the laboratory experiments and interactive checkpoint assessments and lab exams during the labs.
- Developing capable independent and collaborative enquiry, through a series of tutorials spanning the duration of the course.
- Developing digital and information literacy and lifelong learning skills through assignment work.
- Developing ethical practitioners who are collaborative and effective team workers, through group activities, seminars and tutorials.
- Developing independent, self-directed professionals who are enterprising, innovative, creative and responsive to change, through challenging design and project tasks.
- Developing citizens who can apply their discipline in other contexts, are culturally aware and environmentally responsible, through interdisciplinary tasks, seminars and group activities.

<more detail: https://my.unsw.edu.au/student/atoz/GraduateAttributes.html – please consult this particularly if your course develops skills in team work, leadership, design (innovation and creativity), ethics or communication skills>
