COURSE STAFF

The primary course coordinator and lecturer is:
Dr Iain MacGill
Joint Director (Engineering), Centre for Energy and Environmental Markets (CEEM)
Associate Professor, School of Electrical Engineering and Telecommunications.
Room TETB316 (Tyree Energy Technology Building), i.macgill@unsw.edu.au

Consultations: You are, of course, encouraged to ask questions on the course material during the online lectures. Iain will also be arranging a weekly 30 minute consultation meeting where students can ask questions on any aspect of the course. There will also be a number of discussion forums on the course MS Teams group and/or Moodle for questions regarding logistics, lecture materials and assessment tasks. Please always check these first to see if your questions have already been asked and answered, and post your questions there if you think they are relevant to other students. Please note that Iain is unlikely to be available for consultations without an appointment first being made by email. Additional consultation times for the assignments and projects will be advised during lectures, and on the course Moodle. Note that ALL email enquiries must be made from your student email address with ELEC9714 mentioned in the subject line. In particular, I am not allowed to discuss any course matters with students who email from non-UNSW email accounts to avoid possible privacy breaches.

Keeping Informed: Announcements may be made during online lectures, via email (to your student email address) and/or via online learning and teaching platforms – in this course, we will use Moodle https://moodle.telt.unsw.edu.au/login/index.php and MS Teams. Please note that you will be deemed to have received this information, so you should take careful note of all announcements.

COURSE SUMMARY

Contact Hours
This is a 6 UoC course and the expected workload is around 15 hours per week throughout the 11 week term. As noted below, most of this time must be self-directed learning. As a post-graduate offering, the course consists of 4 hours of online lectures each week from weeks 1 to 9. The last one to two weeks of term will involve student seminar presentations via MS Teams. There are no tutorials or laboratories. However, there may be tutorial like sessions within some of the online lecture slots. The provisional syllabus of these weekly online lectures is outlined below. Note also that there will be some scheduled consultations for the assignments, and group project discussions. Details will be made available in the online lectures and on MS Teams/Moodle.

Context and Aims
The purpose of this course is to introduce students to the main issues involved in electricity industry planning and economics – that is, decision making approaches and methods to meet longer-term industry objectives. This will be considered in the context of both traditional monopoly utility run power systems, and the restructured market-based industries now becoming more common worldwide. Furthermore, it will also explore the challenges and opportunities that renewables and distributed energy resources bring to these issues.
# Indicative Lecture Schedule

COURSE DETAILS

Credits
This is a 6 UoC course and the expected workload is 15 hours per week throughout the 10-week term.

Relationship to Other Courses
This is a postgraduate course in the School of Electrical Engineering and Telecommunications. The course is available in the following programs: Master of Engineering Science; Doctor of Philosophy in Engineering, Master of Engineering and Bachelor of Engineering (4th Year Elective substitution). Students undertaking other courses may also be permitted subject to agreement with the School of Electrical Engineering and Telecommunications, and the Course Coordinator.

The companion course, ELEC9715 Electricity Industry Operation and Control explores presents decision making approaches and methods to meet shorter-term industry objectives through appropriate operation and control of existing, in place, power system equipment. These courses can be taken separately, or in either sequence. This course replaces the old ELEC9201 Power System Planning and Economics.

Pre-requisites and Assumed Knowledge
Although this subject has no formal prerequisites, it is assumed that each student has a basic working knowledge of power systems, and the electricity industry more generally. A number of texts are available for students whose undergraduate training did not include this type of material, or who feel that they require revision. Please contact the lecturer to discuss if you have questions regarding this matter. It is further assumed that students are familiar with Standard Office software tools including Excel, Word and Powerpoint (or equivalents).

Following Courses
The course is not a pre-requisite for other courses at UNSW. However, it does have close links to its companion course, ELEC9715 Electricity Industry Operation and Control. There is some cross-over between the two courses but they are also carefully designed to complement each other whilst not requiring that you take them in sequence, or take both of them.

Learning outcomes
After successful completion of this course, you should be able to:

1. Understand the fundamental objectives, constraints and concepts of electricity industry planning, economics and investment.
2. apply basic conventional ‘optimal generation mix’ planning techniques to simple electricity industry investment problems
3. describe the implementation of electricity industry planning and investment in a restructured industry context including the role of energy spot and derivative markets
4. apply basic models of electricity markets to simple restructured electricity industry problems involving operation and investment.
5. appreciate how electricity industry restructuring, technology development and environmental concerns are changing the way in which electricity industry planning, economics and investment is defined and undertaken
6. describe the opportunities and challenges that emerging distributed energy resources pose for future electricity industry planning, economics and investment.

This course is designed to provide the above learning outcomes which arise from targeted graduate capabilities listed in Appendix A. The targeted graduate capabilities broadly support the UNSW and Faculty of Engineering graduate attributes (listed in Appendix B). This course also addresses the Engineers Australia (National Accreditation Body) Stage I competency standard as outlined in Appendix C.
Syllabus
The nature of the electricity and gas industries; climate change and the electricity industry; objectives & options for restructuring; insights from electricity pricing theory; wholesale electricity market design; Australia's restructured electricity industry; National Electricity Market design & performance; the role of electricity networks in a restructured electricity industry including market representation, network pricing and network regulation; ancillary services; design & implementation of retail electricity markets; electricity industry regulation.

TEACHING STRATEGIES

Delivery Mode
The teaching in this course aims at establishing a good fundamental understanding of the areas covered using:
- Formal on-line lectures, which provide you with a focus on the core analytical material in the course, together with qualitative, alternative explanations to aid your understanding;
- Tutorial style components in some of the on-line lectures which allow for exercises in problem solving;
- Small periodic quizzes to test your understanding, and your views on key issues

Learning in this course
You are expected to attend the on-line lectures in order to maximise learning. In addition to the lecture PowerPoints, you should read relevant sections of any recommended texts and other materials. Reading additional texts and reports will further enhance your learning experience. Group learning is also encouraged. UNSW assumes that self-directed study of this kind is undertaken in addition to attending classes throughout the course.

The on-line lectures will make extensive use of PowerPoint slides and a range of activities. Summary PowerPoint printouts will be provided on the course MS Teams / Moodle website. Additional information and reading materials will also be progressively made available on Moodle, but they are no substitute for accurate notes, and active student participation through questions and informal exercises during the on-line. It is also intended that you will be provided with access to a number of on-line data sources for the Australian National Electricity Market.

ASSESSMENT

The assessment scheme in this course reflects the intention to assess your learning progress through the semester. Assessment will consist of a group report on an agreed topic related to material covered in the course; a group wiki and project pitch to the class, various class participation activities, class assignments taken individually and the final exam. Satisfactory performance in both the class based assessment and examination is required to pass this course.

Assignments
The assignments allow self-directed study leading to the solution of partly structured problems. Marks will be assigned according to how completely and correctly the problems have been addressed and the understanding of the course material demonstrated by the report.

These assignments must be undertaken by students individually. There will be two such assignments during the semester. Provisional dates for assignment distribution and submission are provided in the course syllabus.

Project report and wiki
The project will involve students in an activity suited to their interests and skills in the area of electricity industry planning, economics and investment. Groups of five students are very strongly preferred, although smaller groups may also be permitted if and as appropriate – groups and topics must be approved by the course coordinator. In particular, students undertaking a fourth year engineering thesis or post-graduate research thesis should not choose an elec9714 project topic that closely relates to their other thesis research. Similarly, students are strongly encouraged not to choose a project that closely relates to any other projects that they have undertaken – for example, in elec9715 or other electricity industry related courses.

The intent of these group elec9714 projects is to expose you to electricity industry planning and economics issues other than those you might already have already worked on, or are currently working on. Note also that the large student numbers this year will make smaller groups than 4 students particularly challenging to manage.
Projects will either focus on

- development and testing of a simple software, spreadsheet or Matlab power system modelling and optimisation tool, or
- an in-depth literature survey of some aspect of electricity industry planning, economics and investment (around 5000 words plus tables, diagrams, references etc.).

More information on these projects and suitable topics will be distributed in week 2 and project topics are to be negotiated and finalised by week 5. Details on the formal requirements for the project reports will also be provided at this time. It should contain a significant review of the literature relevant to the topic and a comprehensive bibliography. All source material must be adequately referenced in the body of the report and it is expected that there will be 25 or more scholarly references in a literature survey. It is also required that the project will include some analysis of actual electricity industry economic and/or market data. The report will be assessed on the quality of the content and presentation.

Given student numbers, we will be using group wikis this year. Each group is required to establish a wiki on Moodle and use this to communicate their project work and findings with other students taking the course. It is envisaged that you will post early discussions regarding your topic and host a question forum where other students can come and ask questions or provide comments. You will also need to prepare a slide pack and are invited to undertake additional communication activities such as brief videos. You will also have a chance to do a six to seven minute short seminar of your project in week 10 (perhaps also week 9, subject to student numbers). These seminars will be presented by the group on MS. All students are required to attend these sessions on-line and provide a peer mark for each group.

Assessment of the wikis will be based on the quality and comprehensiveness of the materials and discussion with other students in the course, with extra marks for innovative communication strategies. Each student will receive an individual mark according to the quality and extent of engagement in other student group projects through the wikis, as well as other on-line activities over the semester.

More details will be provided on the projects and wikis during the on-line lectures, and on MS/Teams / Moodle. For all of the non-exam assessment tasks in this course, it is essential that you have a complete understanding of the UNSW official position on ‘In-class assessment and plagiarism’ as outlined below. Please note that there are severe penalties associated with plagiarism offences.

Final Exam
The exam in this course will be a 2 hour written examination, comprising four compulsory questions. University approved calculators are allowed. The examination tests analytical and critical thinking and general understanding of the course material. Questions may be drawn from any aspect of the course unless specifically indicated otherwise by the lecturer. Specific arrangements given on-line presentation of the course will be advised when confirmed.

COURSE RESOURCES

Textbooks
There is no assigned textbook for this subject. The more recent concepts relevant to electricity industry planning and economics in restructured industries are not easily found in textbooks. The UNSW library has a number of power system planning books dating from the 1960s to 1990s. Some of these have useful descriptions of traditional optimal generation mix techniques. However, they generally have very little to say about planning, economics and investment in restructured industries. There are several more recent books on electricity industry economics and markets including, notably, Stoft, 2002. Unfortunately it is rather US centric, as are several of the other books.

On-line resources
Instead of an assigned text book, regular updates and course materials will be added to the course Moodle website and MS Teams group. You should check both these sites frequently. Materials will include summary pdf versions of the lecture PowerPoints (also provided as printouts prior to each on-line lecture). A range of reports, papers and websites will be uploaded throughout the term to provide more background on electricity industry planning, economics and investment within the restructured Australian electricity industry, as well as internationally.

Another useful website is that of the UNSW Centre for Energy and Environmental Markets (CEEM) found at www.ceem.unsw.edu.au. It contains useful papers and presentations covering many of the topics that are explored during the course.

Moodle and MS Teams
As a part of the teaching component, Moodle and MS Teams will be used to disseminate teaching materials, host forums and occasionally quizzes. On-line lectures will all be recorded. Assessment marks will also be made available via Moodle: https://moodle.telt.unsw.edu.au/login/index.php.

Mailing list
Announcements concerning course information will be given in the on-line lectures and/or on Moodle and/or via email (which will be sent to your student email address).

OTHER MATTERS

Dates to note
Important Dates available at: https://student.unsw.edu.au/dates

Academic Honesty and Plagiarism
Plagiarism is the unacknowledged use of other people’s work, including the copying of assignment works and laboratory results from other students. Plagiarism is considered a form of academic misconduct, and the University has very strict rules that include some severe penalties. For UNSW policies, penalties and information to help you avoid plagiarism, see https://student.unsw.edu.au/plagiarism. To find out if you understand plagiarism correctly, try this short quiz: https://student.unsw.edu.au/plagiarism-quiz.

Student Responsibilities and Conduct
Students are expected to be familiar with and adhere to all UNSW policies (see https://student.unsw.edu.au/guide), and particular attention is drawn to the following:

Workload
It is expected that you will spend at least 15 hours per week studying a 6 UoC course, from Week 1 until the final assessment, including both on-line classes and independent, self-directed study. In periods where you need to need to complete assignments or prepare for examinations, the workload may be greater. Over-commitment has been a common source of failure for many students. You should take the required workload into account when planning how to balance study with employment and other activities.
Attendance
Regular and punctual attendance at all on-line is expected.

General Conduct and Behaviour
Consideration and respect for the needs of your fellow students and teaching staff is an expectation. Conduct which unduly disrupts or interferes with a class is not acceptable and students may be asked to leave that activity.

Work Health and Safety
UNSW policy requires each person to work safely and responsibly, in order to avoid personal injury and to protect the safety of others.

Special Consideration and Supplementary Examinations
You must submit all assignments and attend all examinations scheduled for your course. You can apply for special consideration when illness or other circumstances beyond your control interfere with an assessment performance. If you need to submit an application for special consideration for an exam or assessment, you must submit the application prior to the start of the exam or before the assessment is submitted, except where illness or misadventure prevent you from doing so. Be aware of the “fit to sit/submit” rule which means that if you sit an exam or submit an assignment, you are declaring yourself well enough to do so and cannot later apply for Special Consideration. For more information and how to apply, see https://student.unsw.edu.au/special-consideration.

Continual Course Improvement
This course is under constant revision in order to improve the learning outcomes for all students. Please forward any feedback (positive or negative) on the course to the course convener or via the online student survey myExperience available on Moodle. You can also provide feedback to ELSOC who will raise your concerns at student focus group meetings. As a result of previous feedback obtained for this course and in our efforts to provide a rich and meaningful learning experience, we continue to evaluate and modify our delivery and assessment methods.

Administrative Matters
On issues and procedures regarding such matters as special needs, equity and diversity, occupational health and safety, enrolment, rights, and general expectations of students, please refer to the School and UNSW policies: https://student.unsw.edu.au/guide https://www.engineering.unsw.edu.au/electrical-engineering/resources

APPENDICES

Appendix A: Targeted Graduate Capabilities
Electrical Engineering and Telecommunications programs are designed to address the following targeted capabilities which were developed in conjunction with the requirements of professional and industry bodies:

- The ability to apply knowledge of basic science and fundamental technologies;
- The skills to communicate effectively, not only with engineers but also with the wider community;
- The capability to undertake challenging analysis and design problems and find optimal solutions;
- Expertise in decomposing a problem into its constituent parts, and in defining the scope of each part;
- A working knowledge of how to locate required information and use information resources to their maximum advantage;
- Proficiency in developing and implementing project plans, investigating alternative solutions, and critically evaluating differing strategies;
- An understanding of the social, cultural and global responsibilities of the professional engineer;
- The ability to work effectively as an individual or in a team;
- An understanding of professional and ethical responsibilities;
- The ability to engage in lifelong independent and reflective learning.
Appendix B: UNSW Graduate Capabilities

The course delivery methods and course content directly or indirectly addresses a number of core UNSW graduate capabilities, as follows:

- Developing scholars who have a deep understanding of their discipline, through lectures and solution of analytical problems in tutorials and assessed by assignments and written examinations.
- Developing rigorous analysis, critique, and reflection, and ability to apply knowledge and skills to solving problems.
- Developing digital and information literacy and lifelong learning skills through assignment work.
- Developing ethical practitioners who are collaborative and effective team workers, through group activities, seminars and tutorials.
- Developing independent, self-directed professionals who are enterprising, innovative, creative and responsive to change, through challenging design and project tasks.
- Developing citizens who can apply their discipline in other contexts, are culturally aware and environmentally responsible, through interdisciplinary tasks, seminars and group activities.
